

What Is a Data Warehouse?

VS Database ... key →
real-time analytics

- **Definition:** *A single, complete and consistent store of data obtained from a variety of different sources made available to end users in a way they can understand and use in a business context. [Barry Devlin]*
- **By comparison:** an OLTP (on-line transaction processor) or operational system is used to deal with the everyday running of one aspect of an enterprise.
- OLTP systems are usually designed independently of each other and it is difficult for them to share information.

Metadata Object

- SQLAlchemy Column object represents a **column** in a database table which is in turn represented by a **Table** object. **Metadata** contains definitions of tables and associated objects such as *index*, *view*, *triggers*, etc.

```
>>> import sqlalchemy as db  
>>> meta = db.MetaData()
```

Name	Name of the table
Metadata	MetaData object that will hold this table
Column(s)	One or more objects of column class
